Outline

- Academic Principles
- Case Study – 75,000-visit ED
- **Approach to Staffing Optimization**
 - Define Demand
 - Define Capacity
 - Contextualize
- Conclusions

Basic Approach to Staffing

1. Define the arrival *Demand*
2. Define and align the server *Capacity* (physician, nurse, APC, resident, bed productivity)
3. Execute in the *Context* of your current operational environment

Basic Approach to Staffing

1. Define the arrival *Demand*
2. Define and align the server *Capacity* (physician, nurse, APC, resident, bed productivity)
3. Execute in the *Context* of your current operational environment

1. Define the Arrival Demand

- Arrival demand defines the demand for healthcare delivery
- Is the primary driver for physician, APC, and resident staffing

1. Demand – Hour of Day Variation

- Peak usually starts between 8a and 11am
- Usually ends between 9pm and 11pm
- Typically between 4:1 and 6:1 peak vs overnight arrivals
- Pediatrics and low acuity – higher evenings

1. Demand – Hour of Week Variation

- Volume varies significantly by day of week in most institutions
- Weekend volume is usually lower than weekday volume
- Mondays are usually the busiest and also have the highest acuity
- Pediatrics will have much higher weekends and evenings

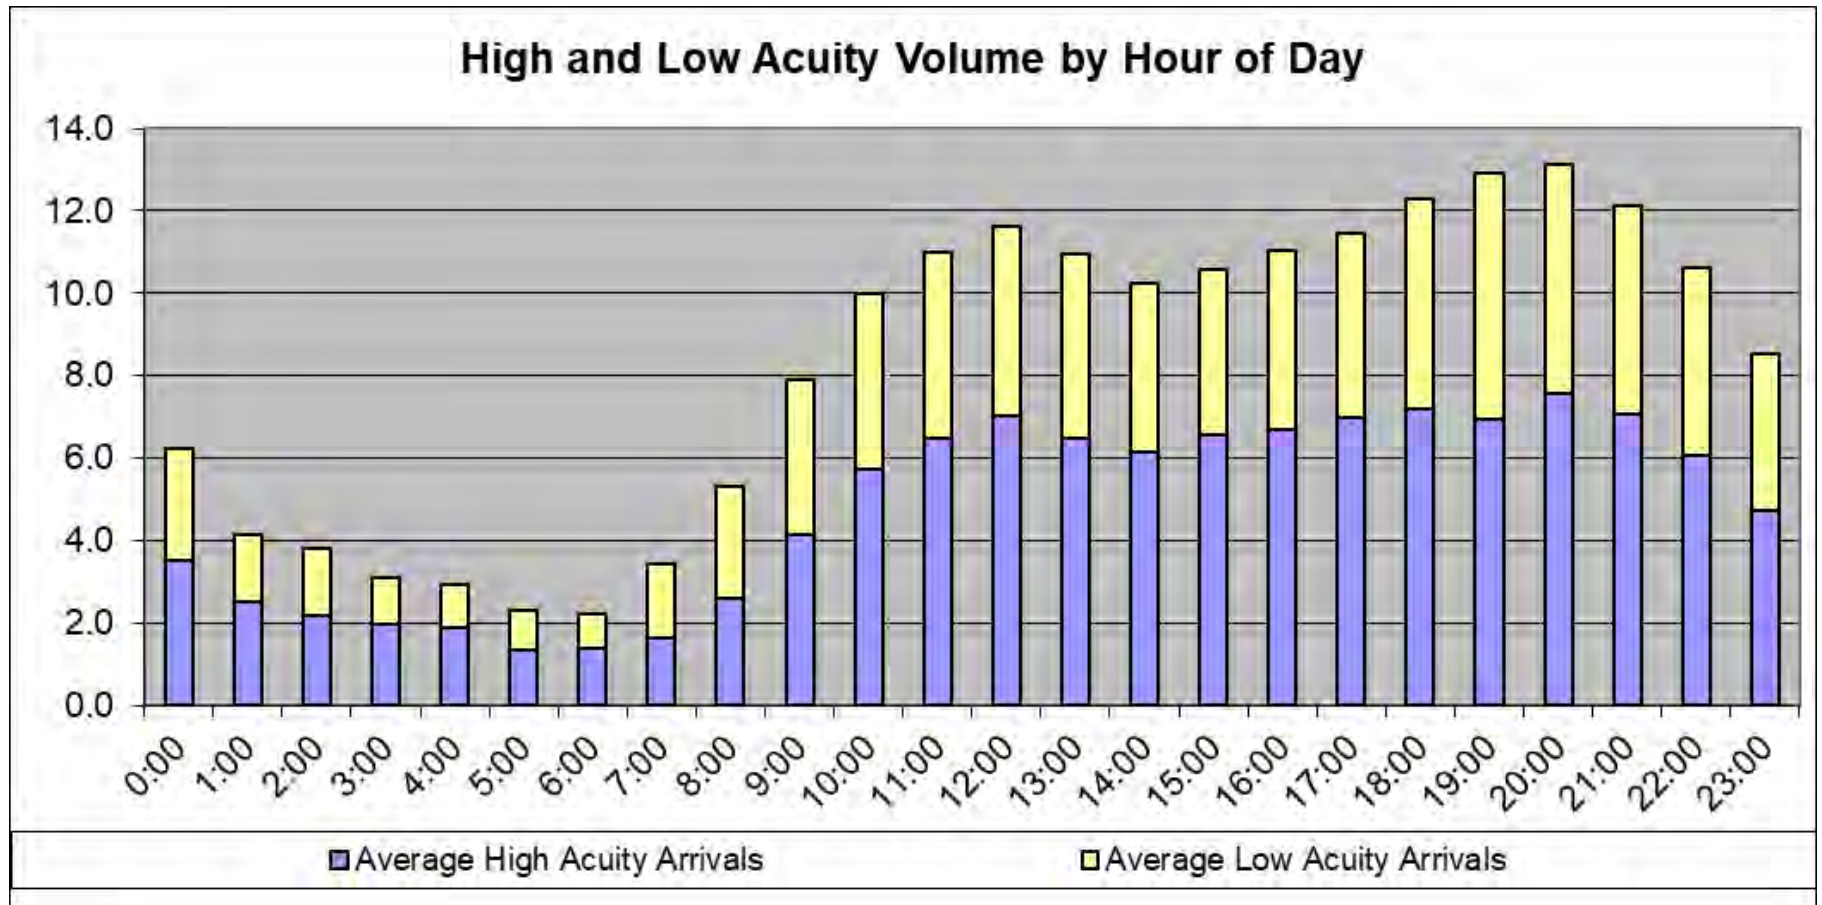

1. Demand - Seasonal Variation

- Seasonal Variation can be problematic if not considered
- Ultimately affects the size of your ED and the operational approach
- Peds follows this profile
- Need specific strategies to staff appropriately – part time staffing, preferential vacations, snowbird scheduling

1. Demand - Acuity

1. Demand – Special Demand COVID-19

Emergency Medicine
2021 Volume Compared to 2019
Association with Emergency Medicine COVID volume

The 2020 holiday wave aligns most closely with the current volume experience; both in timing around the holiday season and the depth of the volume suppression. This led to its use as the historical model point for the analysis.

Basic Approach to Staffing

1. Define the arrival *Demand*
2. Define and align the server *Capacity* (physician, nurse, APC, resident, bed productivity)
3. Execute in the *Context* of your current operational environment

2. Define Server Capacity

1. Assess the volume over a week and divide by the total staffing hours

$$\frac{1400 \text{ pts/wk}}{700 \text{ doc hrs/wk}} = 2 \text{ pts/hr}$$

2. Capacity – Average Service Rate

1. Assess the volume over a week and divide by the total staffing hours

$$\frac{1400 \text{ pts/wk}}{700 \text{ doc hrs/wk}} = 2 \text{ pts/hr}$$

2. Peak productivity will usually be higher as lower overnight volumes tend to drive the overall average down

$$\frac{1100 \text{ pts/wk}}{500 \text{ doc hrs/wk}} = 2.2 \text{ pts/hr}$$

Benchmarks are Scarce

Nursing

- No source for ideal productivity
- Most recommendations are from nurse advocate organizations
- Growing evidence that lower nurse staffing results in increased morbidity, mortality, and cost

Physician

- No source for ideal productivity
- ACEP, SAEM, AAEM all have position statements
- Other studies are largely inaccurate, outdated

Recommended Benchmarking Sources: ACEP; Premier; EDDBA; VHA

4,000 Clicks

The screenshot shows the journal's header with the title 'The American Journal of Emergency Medicine' and navigation links like 'RSS Feeds', 'Mobile', 'Login', 'Register', and 'Subscribe'. Below the header is a search bar and a navigation menu. The article title is '4000 Clicks: a productivity analysis of electronic medical records in a community hospital ED'. The authors listed are Robert G. Hill Jr., MD, Lynn Marie Sears, MBA, and Scott W. Melanson, MD. The article is from November 2013, Volume 31, Issue 11, Pages 1591-1594. The abstract is highlighted with a red box and contains the following text:

Abstract

Objective
We evaluate physician productivity using electronic medical records in a community hospital emergency department.

Methods
Physician time usage per hour was observed and tabulated in the categories of direct patient contact, data and order entry, interaction with colleagues, and review of test results and old records.

Results
The mean percentage of time spent on data entry was 43% (95% confidence interval, 36%-47%). The mean percentage of time spent in direct contact with patients was 28%. The pooled weighted average time allocations were 44% on data entry, 28% in direct patient care, 12% reviewing test results and records, 13% in discussion with colleagues, and 3% on other activities. Tabulation was made of the number of mouse clicks necessary for several common emergency department charting functions and for selected patient encounters. Total mouse clicks approach 4000 during a busy 10-hour shift.

Conclusion
Emergency department physicians spend significantly more time entering data into electronic medical records than on any other activity, including direct patient care. Improved efficiency in data entry would allow emergency physicians to devote more time to patient care, thus increasing hospital revenue.

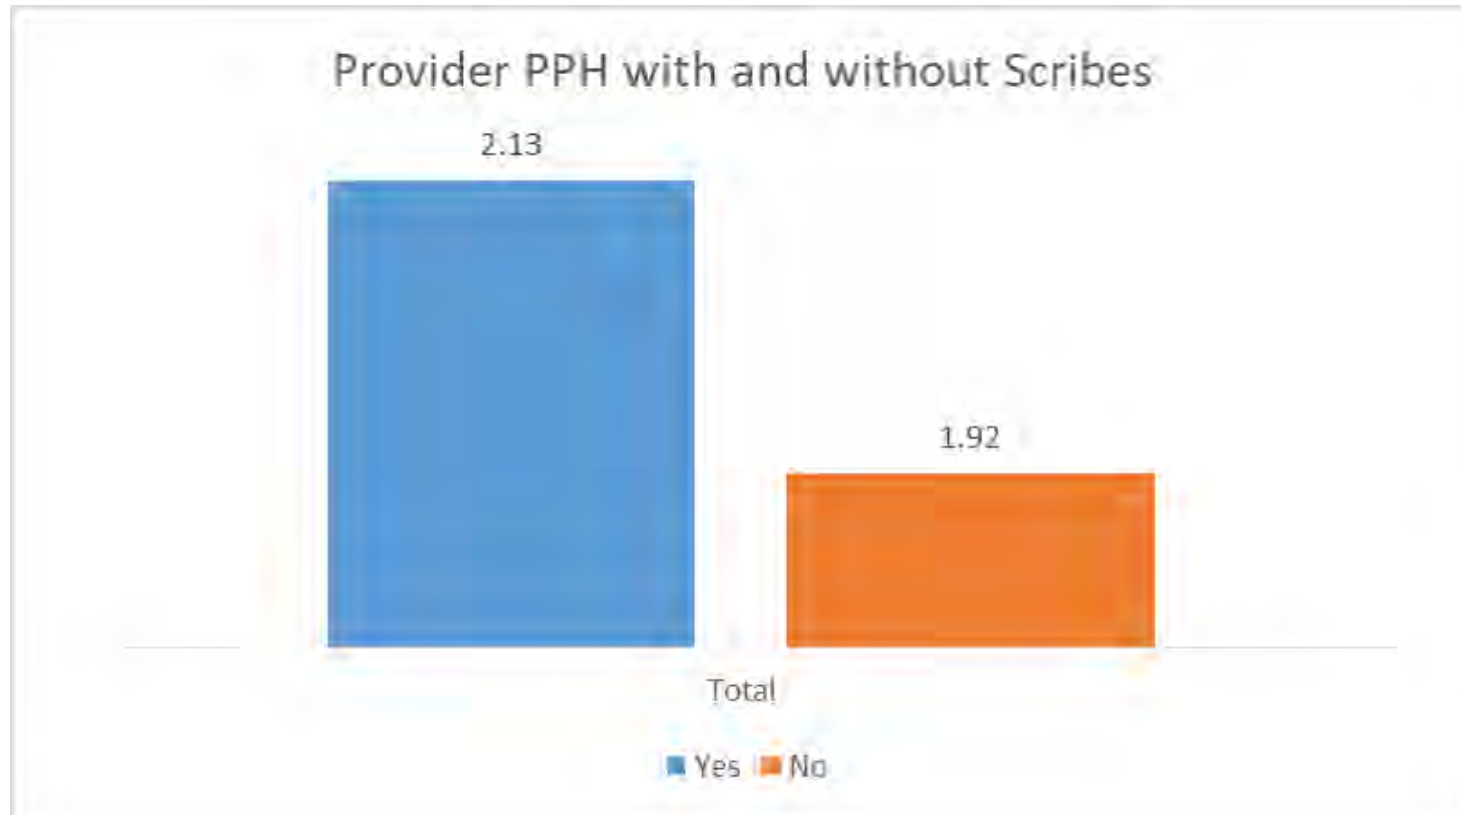

On the right side of the article, there is an 'Article Tools' section with options like 'PDF (319 kB)', 'Download Images (.ppt)', 'Email Article', 'Add to My Reading List', 'Export Citation', 'Create Citation Alert', 'Cited by in Scopus (3)', 'Request Permissions', and 'Order Reprints (100 minimum order)'. Below that is an advertisement for ehealthCAREERS.COM with the text 'Your one destination for high quality jobs from leading medical society journals.'

Shirley Keck, a 61-year-old mother of five, was having trouble breathing one Sunday afternoon, so her daughter, Becky Hartman, rushed her to the emergency room at Wesley Hospital in Wichita, Kan.

Doctors there thought Keck had pneumonia and admitted her. But for the next seven hours, Hartman sat by her mother's bedside watching her condition deteriorate, and seeing her struggle for each breath. She said she repeatedly tried to get help from the nurses.

"I begged for help," she said. "We had plenty of time to get help, and we got none."

Keck did not have pneumonia. She was actually having a heart attack that was causing liquid

Worked Hours per Patient Visit (whppv)

- Nursing worked hours per patient visit:
- WHPPV is just the inverse of the calculation we use for provider pts/hr

$$\begin{array}{c} \text{Pts/hr} \\ \frac{1400 \text{ pts/wk}}{700 \text{ doc hrs/wk}} = 2 \text{ pts/hr} \end{array} \quad \begin{array}{c} \text{inverse} \\ \text{Whppv} \end{array} \quad \begin{array}{c} \frac{1000 \text{ RN hrs/wk}}{600 \text{ pts/wk}} = 1.67 \text{ whppv} \end{array}$$

- Total worked hours per patient visit is calculated similarly, but includes all other staff as well as nurse admin FTEs.

EDBA WHPPV – All Sites

Staffing an ED Appropriately and Efficiently

Many EDs Vary 40% Between Their Slowest and Busiest Days, So Peak Load Crises Are Inevitable. But How Many Are Tolerable?

ACEP News
August 2009

By Martha Collins
ACEP News Contributing Writer

Having the right mix of physicians, nurses, midlevel providers, and support staff in the emergency department can help ensure emergency department efficiency, patient satisfaction, cost-effective care, and medical-legal safety. But just how do you know that you are staffing your emergency department appropriately and efficiently?

"When it comes to ED staffing, there are strategic drivers and tactical drivers. The strategic drivers are quality of care, patient safety, and the level of service you want to deliver. The tactical drivers are patient volume, acuity, patient length of stay, admit holds, physician capabilities, and non-physician staffing," said Kirk B. Jensen, M.D., MBA, who is chief medical officer for BestPractices, Inc. Dr. Jensen also is a faculty member of the Institute for Healthcare Improvement (IHI) in Boston, and chair of IHI's collaborative on Improving Flow in the Acute Care Setting and Operational and Clinical Improvement in the ED.

DR. WELCH is a practicing emergency physician with Utah Emergency Physicians and a research fellow at the Intermountain Institute for Health Care Delivery Research. She has written numerous articles and three books on ED quality, safety, and efficiency. She is a consultant with Quality Matters Consulting and her expertise is in ED operations.

The SuperTrack Is SUPER!

Patient segmentation can improve efficiency, patient care, and other key ED metrics

Other newer examples of patient segmentation include:

- Geriatric ED
- Chest pain center
- Pediatric ED
- Critical decision unit
- Observation unit
- SuperTrack

by SHARI WELCH, MD, FACEP

At emergency departments seeing medium to high volumes of patients, the concept of patient segmentation is becoming popular as a flow strategy.¹³ Patient segmentation means grouping patients requiring similar levels of care and having similar anticipated lengths of stay (LOS) into a geographic area with dedicated staff and resources. The earliest example of patient segmentation is Fast Track, which now has a very compelling body of literature behind it.¹⁴ Other newer examples of patient segmentation include:

- Geriatric ED
- Chest pain center
- Pediatric ED
- Critical decision unit
- Observation unit
- SuperTrack

SuperTrack was pioneered by Jody Crane, MD, in the Mary Washington Hospital Emergency Department in Fredericksburg, Virginia, as part of a complete patient-flow makeover.¹⁵ The Mary Washington ED was seeing more than 100,000 visits when it opened its new doors in 2006 and was plagued with front-end waits and delays. As part of a complete overhaul of its ED patient flow, Crane and his colleagues

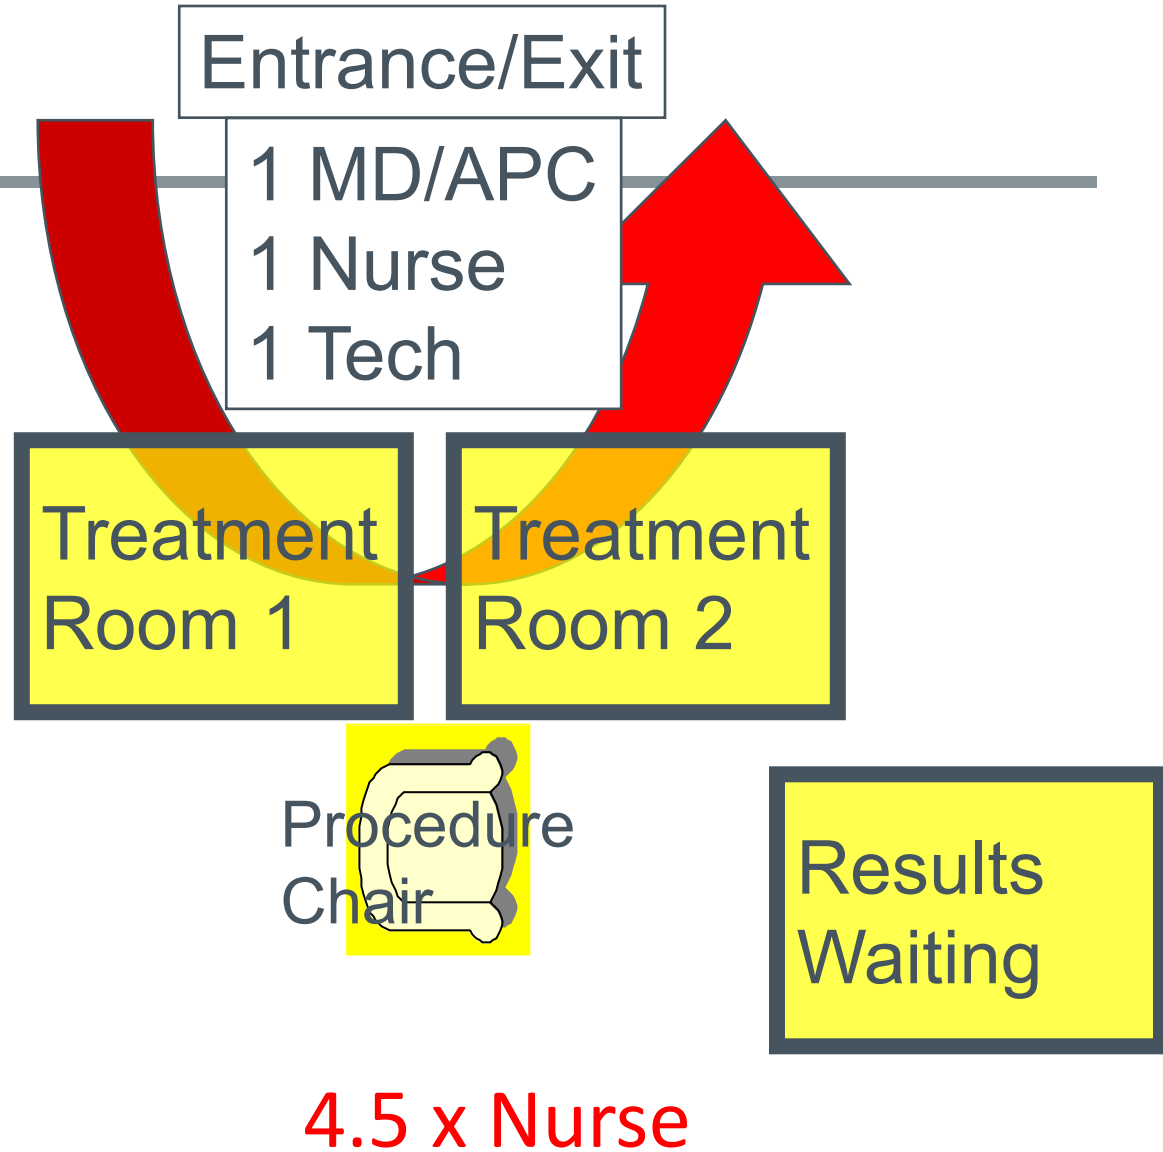

acuity patients (Emergency Severity Index Level 5). It dedicated six rooms as SuperTrack from 8 a.m. to 6 p.m., where identified patients would be seen by a patient care team con-

Once patients were found to meet the SuperTrack criteria, they were quickly placed in a room, and a patient care tech (PCT) would expedite this process and alert the pro-

plies, and staff dedicated to the care of very low-acuity patients. Parkland UCED improved all of its performance metrics, improved the overall flow of the department, and

“Super Track”

Staffing an ED Appropriately and Efficiently

Many EDs Vary 40% Between Their Slowest and Busiest Days, So Peak Load Crises Are Inevitable. But How Many Are Tolerable?

ACEP News
August 2009

By Martha Collins
ACEP News Contributing Writer

Having the right mix of physicians, nurses, midlevel providers, and support staff in the emergency department can help ensure emergency department efficiency, patient satisfaction, cost-effective care, and medical-legal safety. But just how do you know that you are staffing your emergency department appropriately and efficiently?

"When it comes to ED staffing, there are strategic drivers and tactical drivers. The strategic drivers are quality of care, patient safety, and the level of service you want to deliver. The tactical drivers are patient volume, acuity, patient length of stay, admit holds, physician capabilities, and non-physician staffing," said Kirk B. Jensen, M.D., MBA, who is chief medical officer for BestPractices, Inc. Dr. Jensen also is a faculty member of the Institute for Healthcare Improvement (IHI) in Boston, and chair of IHI's collaborative on Improving Flow in the Acute Care Setting and Operational and Clinical Improvement in the ED.

- Symptoms:
 - Elevated patient throughput times
 - High left-without-being-seen rate
 - Low patient satisfaction
 - Clinician behavior in a stressful environment
 - Low clinician satisfaction and retention
- The four key drivers of patient satisfaction:
 - Length of stay
 - Quality of the interactions with providers
 - Quality of the explanations
 - Pain management

One Week's Demand / Capacity

Assumes PA Prod = Future (2.0 pts/hr)

What Are You Sinking About?

YOU CAN DO ANYTHING,
BUT NOT EVERYTHING.

-DAVID ALLEN

Conclusions

- Optimizing staffing in the emergency department requires understanding core flow concepts like queuing theory and the theory of constraints
- An accurate assessment of demand, capacity, and variation is necessary to be successful
- A consistent approach to staffing is necessary to achieve consistent results
- Physician staffing cannot be looked at in isolation and must be contextualized relative to nurse staffing, bed constraints, physical space, skill mix and acuity mix
