## SEPSIS RESUSCITATION: CHALLENGING CASES AND EXCEPTIONS MAY, 2017

LAURENCE DUBENSKY, MD ASSISTANT PROGRAM DIRECTOR RESIDENCY IN EMERGENCY MEDICINE

## **DISCLOSURES:**

None

## DISCLAIMER UPDATES:

- Verdict on fluids still pending
- Expert opinion replaced with growing evidence base
- See attached references

#### E-QUAL EMERGENCY QUALITY NETWORK

## OBJECTIVES

- SEP-1 data review
  - Mortality and exclusions
- Surviving Sepsis Guidelines Update
- Evidence (or lack of) for liberal fluid use
- Thinking about precision medicine and patient centered care

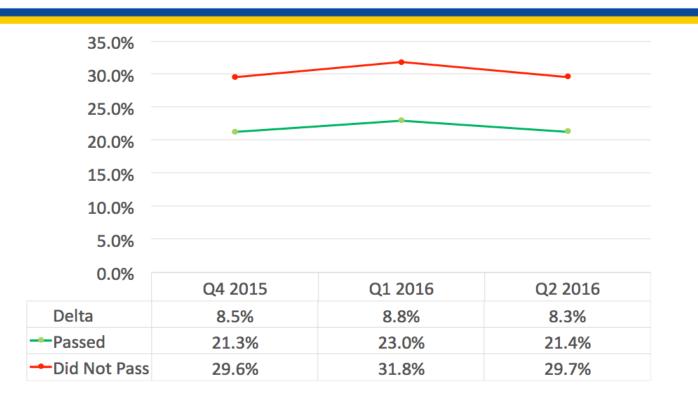

- Attention to High Risk Populations
- Goals of Care

Chest. 2014 Jun;145(6):1407-18

## SEP-1 ACEP DATA

## SEP-1 Mortality Rate Trend for Eligible Population:

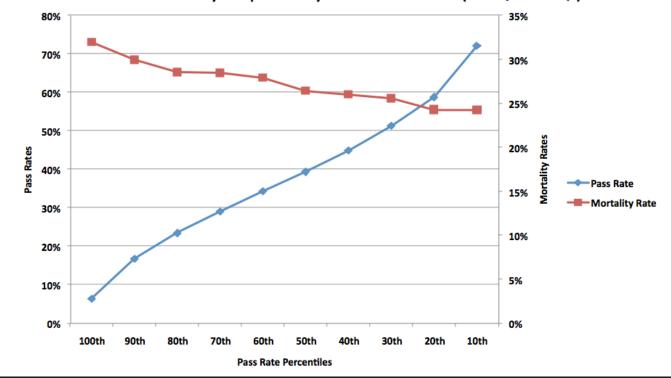

## SEP-1 ACEP DATA

### SEP-1 and Mortality Comparisons by Pass Rate Percentiles (2015Q4 - 2016Q2)

SEP-1 and Mortality Comparisons by Pass Rate Percentiles (2015Q4 - 2016Q2)

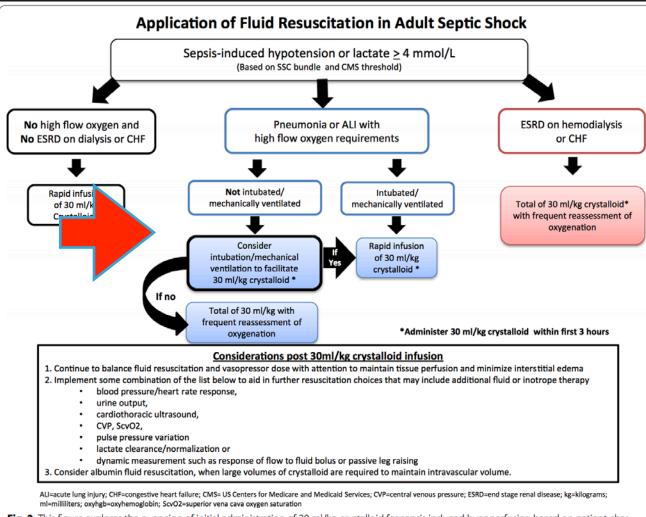

Intensive Care Med (2017) 43:378-379 DOI 10.1007/s00134-017-4680-9 SPECIAL EDITORIAL Practice guidelines as implementation science: the journal editors' perspective Timothy G. Buchman<sup>1\*</sup> and Elie Azoulay<sup>2</sup>

"As clinicians, we are bound to deviate from guidelines when such deviation is reasonably expected to improve an individual patient outcome. As clinical scientists, we are bound to evaluate the prevailing standard against emerging alternatives. These three imperatives are inseparable. We therefore caution against any quality metric or reimbursement policy that mandates slavish adherence to a particular recommendation."

### SURVIVING SEPSIS CAMPAIGN GUIDELINES

**Fig. 2** This figure explores the nuancing of initial administration of 30 ml/kg crystalloid for sepsis induced hypoperfusion based on patient characteristics. It also draws attention to reassessment tools following the initial fluid dose as an influence on further fluid administration or inotropic therapy

"Unfortunately, there is no agreed uniform definition of fluid resuscitation in the literature. Fluid administration is not necessarily the same as fluid resuscitation."

## HEART FAILURE & ESRD

#### **ORIGINAL ARTICLE**

#### Multicenter Implementation of a Treatment Bundle for Patients with Sepsis and Intermediate Lactate Values

Vincent X. Liu<sup>1,2</sup>, John W. Morehouse<sup>2</sup>, Gregory P. Marelich<sup>2</sup>, Jay Soule<sup>2</sup>, Thomas Russell<sup>2</sup>, Melinda Skeath<sup>3</sup>, Carmen Adams<sup>3</sup>, Gabriel J. Escobar<sup>1,2</sup>, and Alan Whippy<sup>2</sup>

<sup>1</sup>Kaiser Permanente Division of Research, Oakland, California; <sup>2</sup>The Permanente Medical Group, Oakland, California; and <sup>3</sup>Kaiser Foundation Hospitals and Health Plan, Oakland, California

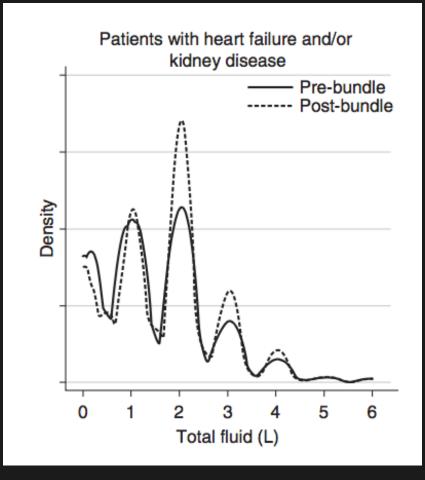

- 18,122 Patients with severe sepsis
- Evaluated bundle compliance effect on mortality
- Specific attention to "CHF" and "CKD"
- Article now cited as "supportive" of aggressive treatment

#### Am J Respir Crit Care Med Vol 193, Iss 11, pp 1264–1270, Jun 1, 2016

## HEART FAILURE & ESRD

- Difference in fluid 0.3L
- Difference in mortality 3-4% (p<.01)</li>
- Legitimate fluids in these patients?
- Misleading evidence given study population, definitions of CHF & CKD

## **EVIDENCE FOR FLUIDS?**

The NEW ENGLAND JOURNAL of MEDICINE

ORIGINAL ARTICLE

### Time to Treatment and Mortality during Mandated Emergency Care for Sepsis

#### Figure 2. Risk-Adjusted Odds Ratios of In-Hospital Death in the Primary Model and Prespecified Subgroups.

Shown are odds ratios, with 95% confidence intervals, for in-hospital death for each hour that it took to complete the 3-hour bundle. Other site of infection includes gastrointestinal, skin, central nervous system, and unknown.

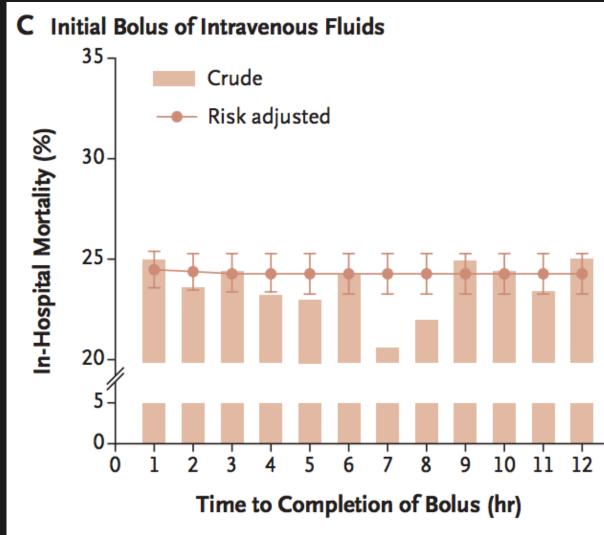

### TIME TO TREAT:

## TIME TO TREAT:

## FLUID RESPONSIVENESS

#### **REVIEW ARTICLE**

#### A rational approach to fluid therapy in sepsis

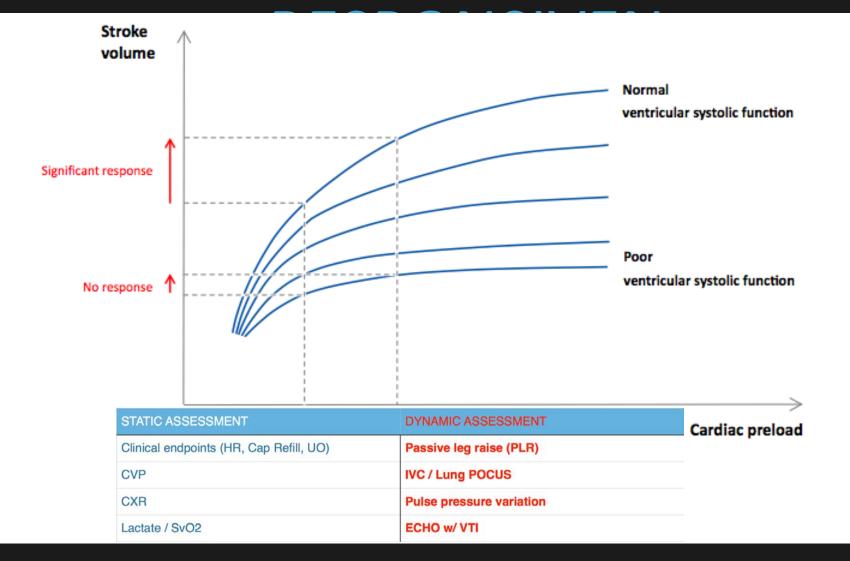

P. Marik<sup>1,\*</sup> and R. Bellomo<sup>2</sup>

<sup>1</sup>Division of Pulmonary and Critical Care Medicine, Eastern Virginia Medical School, 825 Fairfax Av, Suite 410, Norfolk, VA 23507, USA, and <sup>2</sup>Intensive Care Unit, Austin Health, Heidelberg, Victoria, Australia

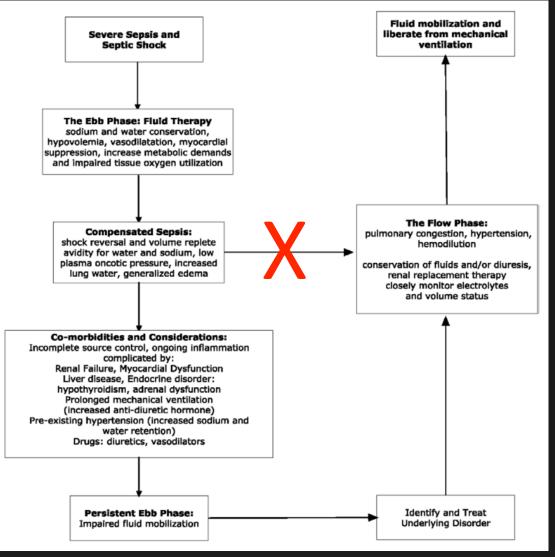

- Increase in SV by 10-15% in response to 250-500cc bolus
- Important to assess fluid tolerance and responsiveness before fluid loading
- Venous capacitance and myocardial dysfunction
- <40% of patients are fluid responders</p>

### "THE EBB AND FLOW:" THOUGHTS ON DE-RESUSCITATION

Crit Care Med. 2016 Dec; 44(12): 2263–2269.

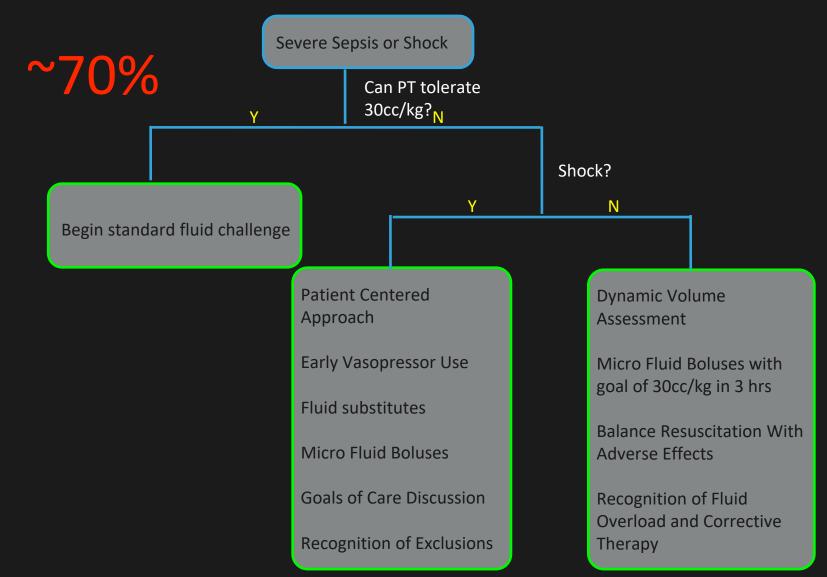

### "SALT WATER DROWNING"

Anaesthesiol Intensive Ther 2014, vol. 46, no 5, 361–380

## DECISIONS...

## HEART FAILURE & PULMONARY HTN

- Types of heart failure
  - Systolic vs diastolic
  - Left, right and biventricular
- Beside ECHO or recent ECHO is key
- Volume responsiveness
- Considerations in right heart failure and pulmonary HTN

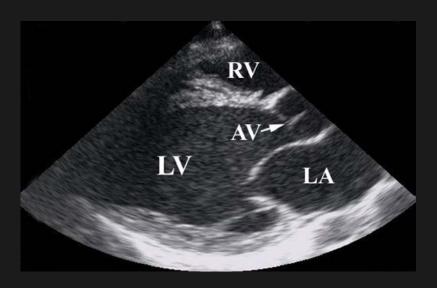

Annals of the American Thoracic Society, Vol. 11, No. 5 (2014), pp. 811-822.

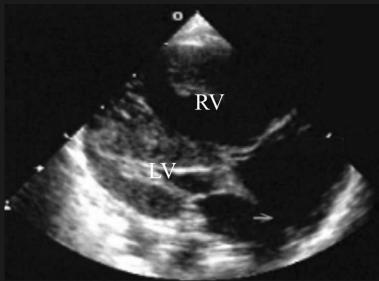

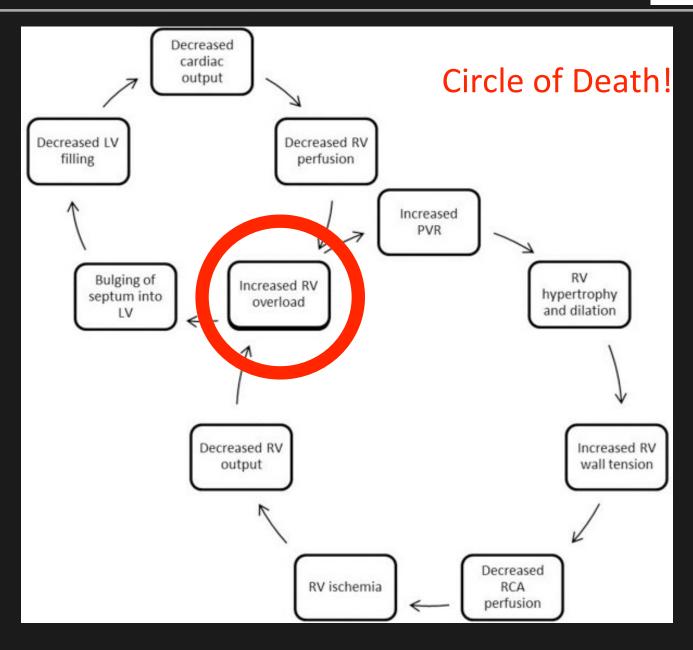

# RIGHT HEART FAILURE & PHYSIOLOGY

- ECHO guided resuscitation
- LV only pumps what it receives
- Isolated right heart failure will not show "CHF" on CXR
- Does not respond well to aggressive fluid resuscitation
- Intubation is associated with increased mortality

## RHF / PAH & SEPSIS

- Early vasopressors
  - Norepinephrine / Epinephrine
  - Vasopressin (pulmonary vasodilator)
    - Decrease RV afterload
- Dobutamine in isolation should be avoided (beneficial as combo therapy)
- Avoid phenylephrine
- May add iNO (even non ventilated patients), PDEi

## RHF / PAH & INTUBATION

- Avoid at all costs
- Profound hemodynamic effects
  - Loss of sympathetic tone
  - Increased thoracic pressure
  - RSI medications
- Risks weighed against hypoxia & hypercarbia
- ARDS type management but low PEEP
- NIV is the better choice

EMERGENC QUALITY

E-QU

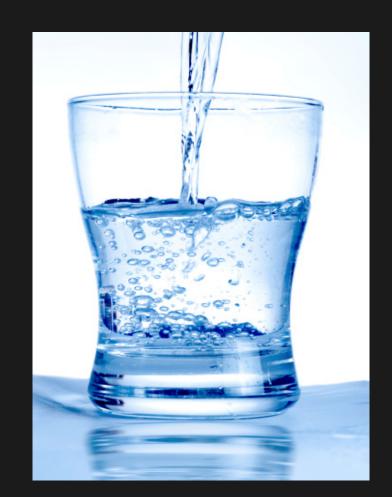

## RHF / PAH: SUMMARY

- Fluids are high risk
- Early pressors / inotropes / change HR on PPM
- Avoid hypoxia, acidosis, hypothermia
- Avoid intubation
- Pulmonary vasodilators
- ECMO / RVAD
- Goals of Care Discussions

## FLUIDS & END STAGE RENAL DISEASE

- Fluid limited / restricted
- Volume assessment / Intravascularly volume depleted
  - fragile volume status
- Choice of crystalloid (NS, LR, balanced)
  - Plasmalyte / Normsol
  - Avoid large volume NS

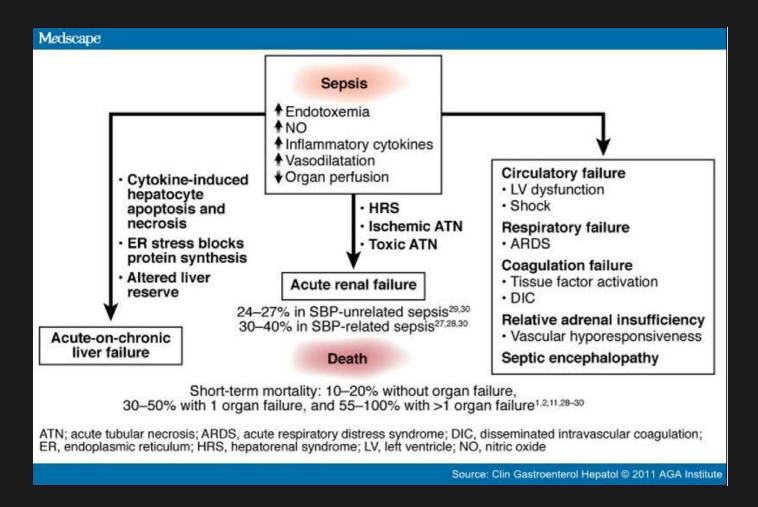

## END STAGE RENAL DISEASE: SUMMARY

- Very sick population, high mortality
- Source control
- Fluid responsiveness essential
- Early vasopressors / Dobutamine
- ► NIV, High Flow O2 > ETT
- Consider: Avoiding NS as crystalloid (acidemia)

## CIRRHOSIS / ACLD

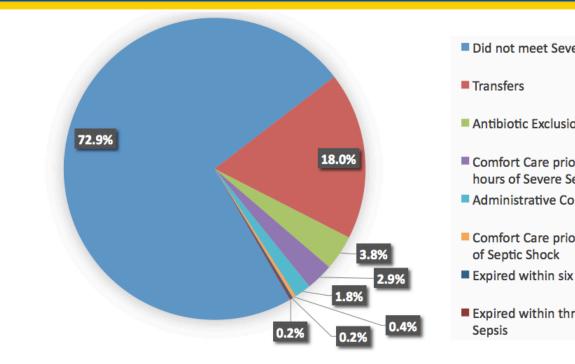

## CIRRHOSIS : SUMMARY

- Very sick population, high mortality
- Fluid responsiveness essential
- Consider colloids (improve mortality, decrease AKI/RRT)
- Consider corticosteroids
- Early vasopressors / Vasopressin (hyporesponsive)
- Consider: Variceal bleeding & Abdominal Compartment Syndrome

### **GOALS OF CARE : HIGH RISK POPULATIONS**

### **Breakdown of SEP-1 Exclusion Population:**

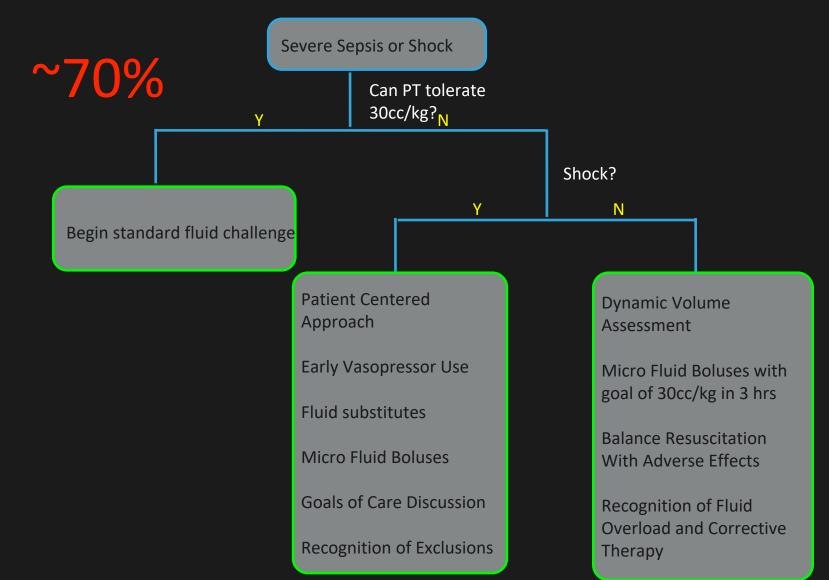

Did not meet Severe Sepsis Criteria

- Antibiotic Exclusion
- Comfort Care prior to or within three hours of Severe Sepsis Presentation
- Administrative Contraindication to Care
- Comfort Care prior to or within six hours
- Expired within six hours of Septic Shock
- Expired within three hours of Severe

Note: Cumulative data from October 2015 – March 2016

## **CLOSING STATEMENTS**

## FINAL THOUGHTS...

- Fluids are medications
- Become familiar with volume assessment
- Early pressors / inotropes
- Precision, patient specific management
- Avoid intubation / Use NIV
- Goals of Care Discussions
